Install MobaXterm or any toolbox for connecting. We can use the [terminal](#) also. In this tutorial we will be using MobaXterm to connect with our EC2 Machine.

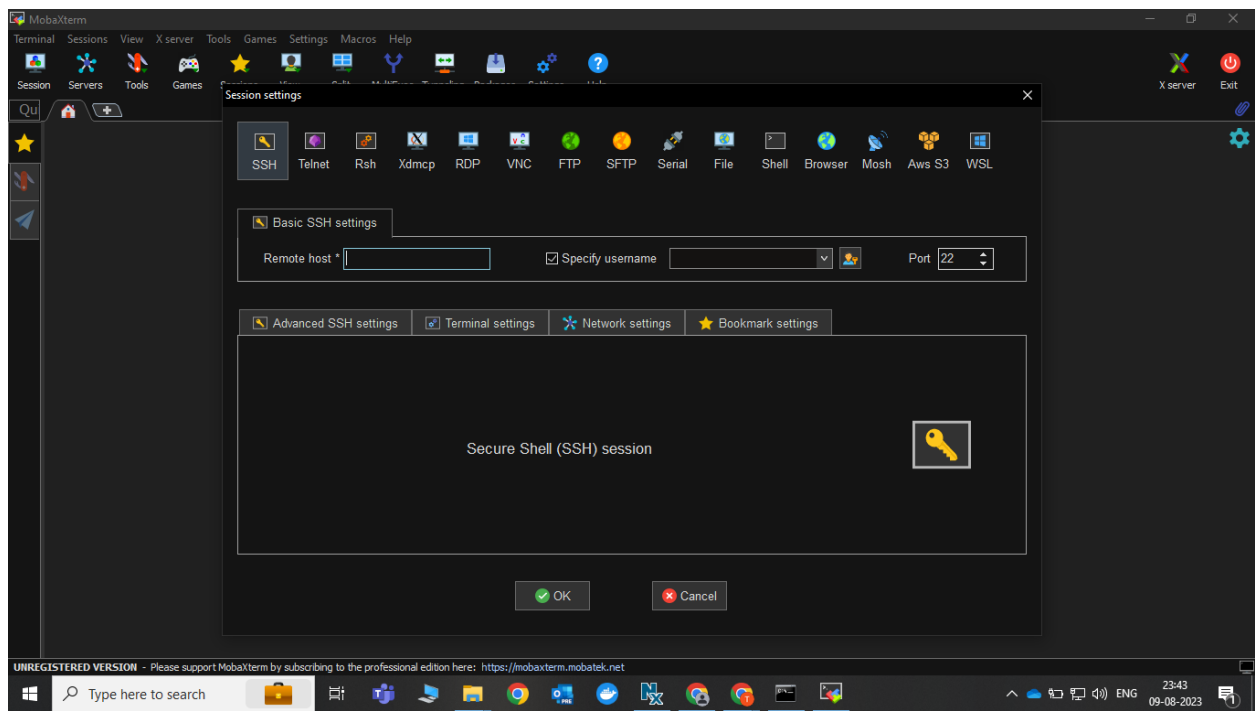

1. On the top left hand corner, click on Session.

2. Once then click on SSH

3. Now we will add the public IP address of our EC2 Machine and username. By default the username will be ubuntu if we choose that OS..

4. Once that is filled, click on the checkbox "Use private key". Here we need to add the authorization key which will be the .pem file.

5. After giving that file, click on OK and our EC2 Machine is good to go.
